

6/13/2001 At 0911, I found the beam, I got a light, by moving the Flip-in mirror from the FORWARD LIMIT, in minus 20 steps, to a reading of -1574. The Steps/sec was = 5. The Steps/sec*2 = 10, The Accel Factor = 5. This moved the spot across the monitor at a very reasonable rate. To center the spot, required a little adjustment with the PICO

motor in the upward direction.
